condidate target for treating a specific condition or disease predicted to be associated with FMO2 activity, e.g. drug toxicity, and in the design of clinical trials for treating a specific condition of disease associated with FMO2 activity. e.g. drug toxicity, and in the design of clinical trials for treating a specific condition of disease associated with FMO2 activity. The methods are also useful for screening FMO2. The mucleic acid of the invention is useful in studying the expression and function of FMO2, and in expressing FMO2 protein for use in screening for candidate drugs to treat diseases related to FMO2 activity. It is also useful in studying the effect of the variation on the biological activity of FMO2 swell as on the binding affinity of candidate drugs targeting FMO2 for the treatment of drug toxicity. The invention is useful for studying the expression of FMO2 isogenes in vivo, for in vivo screening and testing of drugs targeted against FMO2 protein, and for testing the efficacy of therapeutic agents and compounds for treating drug toxicity in a biological system. The objection of sequence represents an allele-specific consideration of the methods of the content of drugs that the was used in the methods of the content of a primer that was used in the methods of the content of The present invention relates to a new polynucleotide which comprises thavin contraining monoxygenase-2 (FMO2) isogenes. The invention is useful in screening for drugs that are useful for treating drug toxicity. The methods of the invention are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with FMO2 activity. The methods are also used by the pharmaceutical research scientist to validate FMO2 as a Novel genetic variants of Flavin Containing Monooxygenase 2 isogenes, useful for improving efficiency and reliability in drug development for treating developmental bone disorders. New isolated polymorphic variant of human angiotensin receptor-like 1

The invention relates to single nucleotide polymorphisms in the gene encoding the human angiotensin receptor-like 1 (AGTRL1) polypeptide. A encoding the human angiotensin receptor-like 1 (AGTRL1) polypeptide. A careful of the for haplotyping the AGTRL1 gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the AGTRL1 haplotype pair. This method is useful in genotyping, are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype for the haplotype or haplotype pair in a population exhibiting the trait with the frequency of the haplotype or haplotype pair in a population exhibiting the trait with the frequency of the haplotype or haplotype pair in a reference compulation, where a haplotype or haplotype pair in a population of haplotype pair.

AGTRL1 and its corresponding DNA are used for studying the expression and indicates the trait is associated with the haplotype or haplotype pair.

AGTRL1 and its corresponding DNA are used for studying the expression and cliseases related to AGTRL1 activity, such as hypertension. The sequences are also useful for studying the effect of variation on the biological are also useful for studying the effect of variation on the biological activity of AGTRL1 as not the binding affinity of Candidate drugs oligonucleotide probes, sequencing primers and PCR primers used to detect AGTRL1 gene polymorphisms targeting AGTRL1; Sequences ABK16638-ABK16682 represent allele-specific (AGTRL1) gene useful for expressing AGTRL1 protein isoform to screen drugs to treat AGTRL1 activity-related disease. The present sequence is an allele-specific oligonucleotide primer that was designed to detect a specific polymorphism in the human Duffy blood group (FY) gene (see ABL57160). The primer is one of a set (see ABL57167-98) that can be used in a kit for haplotyping or genotyping the FY gene of an individual. The primer has a 3' penultimate nucleotide that is complementary to only one nucleotide of a particular single nucleotide polymorphism, and acts as a primer for polymerase-mediated extension only if the allele containing that nucleotide is present. The invention provides novel genetic variants of the FY gene, and discloses various genotypes, haplotypes and haplotype pairs that exist in the general United States population. Compositions and methods for haplotyping and/or genotyping the FY gene in an individual are also disclosed. The polymorphism and haplotype data are useful for validating FY as a candidate target for treating a condition or disease associated with FY activity, such as malaria and inflammatory discase associated with FY

Genetic variants of Plasminogen activator, Urokinase (PLAU) isogenes, useful for improving efficiency and reliability in drug development for treating thrombolytic disorders and cancer.

Claim 14; Page 14; 92pp; English.

The invention relates to a polynucleotide comprising a first nucleotide sequence (NSI) comprising a PLAU (plasminogen activator, urokinase, a serine protease) isogene selected fusminogen activator, urokinase, at the specification, where each isogene comprises the regions of the plau gene or cDNA and is further defined by the corresponding sequence of polymorphisms (defining single nucleotide polymorphisms, SNP). Also included are methods of haplotyping/genotyping (and predicting the

haplotype/genotype of the PLAU gene of an individual, identifying an association between a trait and at least one haplotype or haplotype pair of the PLAU gene, an isolated oligonucleotide for detecting a polymorphism in the PLAU gene, a recombinant non-human organism transformed or transfected with the gene or CDNA, fragments of the polymorphism in the PLAU gene, a recombinant non-human organism tie, an isolated act least 10 base pairs encompassing a polymorphic variant PLAU protein or fragment, an isolated monoclonal antibody specific for PLAU, a computer system for storing and analysing polymorphism data for the PLAU gene and a genome anthology for the PLAU gene. PLAU is useful in screening for drugs targeting PLAU that are useful for improving the efficiency and cancers. The methods are useful for improving the efficiency and diseases associated with PLAU activity. The antibody is useful in the design of clinical trials for treating a specific condition of diseases associated with PLAU activity. The antibody is useful in diagnostic, prognostic and therapeutic methods. PLAU colludate to PLAU, and in expressing PLAU protein for use in screening for candidate plaus, and in expressing PLAU protein for use in screening for candidate drugs to treat diseases related to PLAU activity. The gene for PLAU is located on chromosome log34-qter. The present sequence is an allele plantation of plantar used to amplify PLAU polymucleotides with a specific polymorphism \$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

New genetic variants of human arylalkylamine N-acetyltransferase (AANAT) gene for studying expression, function of the gene and expressing AANAT protein for use in screening for drugs to treat disorders of pineal

gland.

Claim 16; Page 13; 67pp; English.

```
acetyltransferase (AANAT) gene. The invention also relates to compositions and methods for haplotyping and/or genotyping the AANAT compositions and methods for haplotyping and/or genotyping the AANAT gene. Dolymorphic variants of AANAT polymorlectides are useful for screening for drugs targeting the polypeptide. AANAT polymorlectides are useful for studying the expression and function of AANAT and for expressing AANAT or protein for use in screening for candidate drugs to treat diseases related to AANAT activity. The methods are used to develop diagnostic tests and therapeutic treatment for disorders of pineal gland that derive from defects in melatonin synthesis. It is useful for determining whether an individual has one of the haplotypes 1-4 or the haplotype pairs. The haplotyping method is useful to validate AANAT as a candidate target for treating a specific condition or disease predicted to be associated with AANAT activity. AANAT sequences of the invention are also used in gene therapy and antisense therapy. The present DNA sequence is an allele specific oligonucleotide (ASO) primer which is used for detecting human

New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.

Claim 1; Page 51; 80pp; English

The present invention relates to enzymatic nucleic acids which

. specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin of the substrate the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV contribution as are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV incorpus are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at low low bone mineral density; BMD; bone damage; polymorphism; osteoporosis; single nucleotide polymorphism; SNP; PCR primer; ss; human. The present invention describes a method of determining whether an individual is predisposed to susceptibility to low bone mineral density (BMD) and/or bone damage comprising identifying whether the individual has at least one polymorphism in a polymucleotide encoding a protein, where the polymucleotide is one of 81 200-500 nucleotide sequences (S1, see ADC98125 to ADC98115). An agent identified in an method from the present invention which can be used for the prevention or treatment of disease resulting in susceptibility to low BMD and/or bone damage is to Gaps Bennett S; Determining whether an individual is predisposed to susceptibility (bone mineral density (BMD) and/or bone damage, involves identifying .; 0 4.1%; Score 12; DB 1; Length 15; 75.0%; Pred. useful in the manufacture of a medicament for use in modulating the ausceptibility to low BMD and/or bone damage. The disease associated with low BMD and/or bone damage is osteoporosis. The present PCR primer sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAQ26461-81 are probes which were used within the scope of the invention to type class II HLA DQB1 alleles. These probes were used to screen sequences amplified from the DQB1 gene second exon sequence. This method could be use to identify new DQB1 alleles. This method provides a simple, rapid and precise system for DQB1 typing, including those alleles which cannot be distinguished by scrological methods. The presence or absence of a particular HLA DQB1 allele serves as an indicator of susceptibility to insulin-dependent diabetes mellitus (IDDM). Accurate DQ typing is particularly important in the field of cognan transplantation and in the study of the molecular basis of disease susceptibility. Moreover, samples from unusual sources, eg ancient DNA or forensic samples, can be typed, even when the DNA sample is degraded of colly present in an small amount. The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (LL-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                               Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flk-1; MSD; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fll-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.

AAA21596 to AAA21688 represent their corresponding target sequences;
AAA21689 to AAA22475 and AAA23263 to AAA23326, AAA23343 to
for integrin subunit beta 3, and AAA22476 to AAA23326, AAA23343 to
AAAA2342 represent their corresponding target sequences. The ribozymes of
the invention are used for modulating the synthesis, expression and/or
stability of an mRNA encoding angiogenic factor, especially ARNT,
integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are
especially used to treat cancer, diabetic retinopathy, age related
macular degeneration (ARMD), inflammation, and arthritis, as well as
necvascular glaucoma, myopic degeneration, sporiasis, vertuca vulgaris,
angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber
syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome,
and other syndromes and diseases related to the levels of ARNT, Tie-2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl dydrocarbon nuclear transporter (RNYT) gene, an integrin subunit beta 3 gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA1762 to Freesent ribozyme sequences for ARNT, and AAA1768 to AAA1768 to AAA17684 represent their corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to AAA19155 to AAA19222 represent their corresponding target sequences for Tie-2, and AAA19087 to AAA19223 to AAA19221 represent their corresponding target sequences; AAA19223 to AAA2921501 to AAA21595 represent ribozyme sequences; AAA19223 to AAA29231601 and AAA21501 to AAA21595 represent ribozyme sequences; AAA19223 to AAA292302 to AAA21501 to AAA21595 represent ribozyme
                                                                                                                                                                                                                                                                                                                                                                                 Novel ribozymes for modulating the synthesis, expression and/or stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic;

Forward primer #3 used to sequence UGT2B4 polymorphic fragments.

```
The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl bydrocarbon nuclear transporter (ARNF) gene, an integrin subunit beta 3 gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16675 to AAA17168 to AAA17168 to AAA1768 to AAA1768 to AAA1768 to AAA1768 to AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA1838 to AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA1838 to AAA19087 to AAA19152 represent their corresponding target sequences; AAA1923 to AAA42052 represent their corresponding target sequences; AAA1923 to AAA2051 and AAA2159 represent ribozyme sequences of integrin alpha 6 subunit, and AAA2036 to AAA2160 and AAA21689 to AAA21689 represent their corresponding target sequences; AAA21689 to AAA21675 and AAA2163 to AAA21362. AAA2183 to AAA21689 to AAA21675 and AAA2163 to AAA21362. AAA2183 to AAA21689 to AAA21675 and AAA2168 to AAA21362. AAA2184 to AAA21689 to AAA21689 represent their corresponding target sequences; AAA21689 to AAA21689 represent their corresponding target sequences; corresponding target sequences; and AAA21689 to AAA2189 to AAA21689 to AAA2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.

This sequence represents a primer used to sequence polymorphic fragments of the human UDP-glucuronosyltransferase 284 (UGT2B4) gene. UDP-glucuronosyltransferases (1972) are a family of enzymes that catalyse the glucuronic acid conjugation of a wide range of endogenous and excgenous glucuronic acid conjugation of a wide range of endogenous and excgenous cubstrates. The UGT2B gene subfamily encode steroid metabolizing isoforms to the liver. Alteration of the expression or function of UGTS may effect drug metabolism. The invention relates to non-chromosomal nucleic acid molecules, which comprise human UGT2B sequence polymorphisms (see molecules, which comprise num udf2PB sequence polymorphisms can be used to detect altered UGT2B metabolism of a substrate in an individual. The nucleic acid molecules comprising a human UGT2B sequence polymorphism can be used in screening assays for genotyping individuals, also to predict their rate of metabolism of UGT2B substrate, potential drug-drug interactions and adverse side effects. The polymorphisms can be used as single nucleotide polymorphisms (SNPs) for detecting genetic UGT2B protein. The polymorphisms containing nucleic acid molecules may also be used for generating geneticially modified non-human animals and for obtaining site specific gene modification in cell lines
                                     UDP-glucuronosyltransferase 2B4; UGT2B4; polymorphism; metabolism; SNPs; drug interaction; detect; human; single nucleotide polymorphism; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel human UDP-glucuronosyltransferase sequence, polymorphisms for genotyping individuals to predict rate of metabolism of substrates and for identifying potential drug interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; single nucleotide polymorphism; SNP; genotyping; DNA analysis; allele specific ollogonucleotide; AGC; reduced complexity genome; RCG; genomic classification; identification; DNA fingerprinting; tumour characterisation; hybridisation; ss.

                                                                                                                                                                                                       The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                              Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers.
                                                                                                                                                                                                                                                                                                                                                                                                      4.1%; Score 12; DB 1; Length 17;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA15944 to AAA35947 represent sequences used in the exemplification of the present invention, AAA35948 to

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gane or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 88; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NRY motif) propersessing an NCH motif), a G-cleaver (cleaving RNA with a NRY motif) an amberzyme (cleaving RNA with an NRY motif) an amberzyme (cleaving RNA with an NRY motif) a zinzyme (cleaving RNA with a NRY motif) and the presence of a divalent cation that is preferably Mg⁻²+.

Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more theory of the coll of CD20. The presence of a divalent cation that is preferablar NHL, lymphocytic lymphoma (NHL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, clumban immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably Mg⁻²+. Furthermore, the created may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably Mg⁻²+. Furthermore, the NOGO. The treatment may further comprise the use of one or more coll and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more coll and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more coll and treat a patient having a condition associated with the level of NOGO and a disease, adasted, dementical mervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, dementies or central nervous system (CNS)

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 101; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGOD). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule opssessing an NCH motif), a C-cleaver (cleaving RNA with a NCH niple), a zinzyme (cleaving RNA with an NGN triple!), a zinzyme (cleaving RNA with an NGN triple!), a zinzyme (cleaving RNA with an NGN triple!), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD30 in the presence of a divalent cation that is preferably MG²+. C Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more thearings. In particular, he CD20 targetting nucleic acid may be used to treat lymphoma (MLL), bulky low-grade or follicular non-Hodgkin's lymphoma (MLL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytopaenia, and inflammatory arthropathy The NOGO activity of the createnent may further comprise the use of one or more cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more thear central nervous system (CNS) injury and cerebrocyacular acid may b disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present sequence is a zinzyme molecule of the invention

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, tetinologatoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDENZA), APC, Factor VII, Factor IX, haemoglobin alpha locus apolloportein E (APOR), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGTI), amyloid precursor protain (APC), presentiin-1 (PSENI) and presentilin-2 (PSENI). These can be used in the gene through of diseases

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA, BRCA, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, applicationsyltransferase (UGT1), amyloid precursor protein (LDC), presentlin-1 (PSEN1) and presentlin-2 (PSEN2). These can be used in the gene therapy of diseases such as cancer, adenosine deaminase deficiency, cystic fibrosis.
                                                                                                                                                           Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor ZA; CDRVA3; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VI; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH; APOB; mismatch repair; MSH2; MSH6; hyperlipidaemia; apolipoprotein E; LDDR; familial hypercholesterolaemia; UGT1; syndrome; APP; PSEN1; antisense; UDP-glucuromosyltransferase; amyloid precursor protein; presentlin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligonucleotide for targeted alterations of genetic sequences and for treating cystic fibrosis, comprises at least one mismatch and chemical modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia, Alzheimer's disease, melanoma, adenomatous polyposis of the colon and various syndromes. The present sequence is one of the gene correcting

New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil Kim J; Rice MC, Kmiec EB, Gamper HB, WPI; 2002-106307/14. production

Claim 7; Page 75; 220pp; English.

The invention relates to an oligonucleotide for targeted alteration of a panetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications of the oligonucleotide. The chemical modifications phosphorothioate linkages on a terminus, or a combination of any two or more more of these modifications. The oligonucleotides are useful for directing repair or alteration of plant genetic information. The oligonucleotides are particularly useful for creating plants with desired plantovers, e.g. environmental or abiotic stress tolerance, improved nutritional value (e.g. alterating amino acid content of plants or conferring amino acid over production), herbicide resistance (e.g. glyphosate resistance, imidazolinone and sulphonylurea herbicide tesistance, porphyric herbicide resistance or triazine resistance), disease resistance, modified oil production, modified starch production (e.g. increased starch or production of waxy starch), altered floral morphology (e.g. male-sterile plants) or modified fatty acid content (e.g. reduced palmitate, increased stearate or reduced linolenic acid). The oligonucleotides are also useful for producing albino mutants for the analysis of photosynthetic processes. This sequence represents a genome altering oligonucleotide of the invention

New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved creating plants with desired phenotypes, e.g. stress tolerance, imp nutritional value, herbicide or disease resistance, or modified oil production.

Claim 7; Page 75; 220pp; English.

The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications of the oligonucleotide. The chemical modifications phosphorothioate linkages on a terminus, or a combination of any two or more more of these modifications. The oligonucleotides are useful for directing repair or alteration of plant genetic information. The oligonucleotides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abiotic stress tolerance, improved nutritional value (e.g. altering amino acid content of plants or conferring amino acid over production), herbicide resistance (e.g.

```
glyphosate resistance, imidazolinone and sulphonylurea herbicide resistance, porphyric herbicide resistance or triazine resistance), disease resistance, modified oil production, modified starch production (e.g. increased starch or production of waxy starch), altered floral morphology (e.g. male-sterile plants) or modified fatty acid content (e.g. reduced palmitate, increased stearate or reduced linolenic acid). The oligonucleotides are also useful for producing albino mutants for the analysis of photosynthetic processes. This sequence represents a genome altering oligonucleotide of the invention

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Disclosure; Page 114; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RMA. The novel isolated nucleic of any of the invention are useful as probes and primers for detecting, acids of the invention are useful as probes and primers for detecting, component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and

                                                                                                                                                   ð
```

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the mucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophremia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein Disclosure; Page 436; 720pp; French.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subult of nuclear factor kappa B (NEKB), where (I) is an incozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A gene, in is useful for cleaving RNA comprising a sequence of REL-A gene, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel enzymatic nucleic acid molecules which down regulates expression of

the presence of a divalent cation, especially Mg^2^+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stoomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as chematoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lugus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, especisor. This sequence represents the substrate of a novel enzymatic nucleic acid molecule

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases. 

Claim 3; Page 35; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor configuration. The enzymatic nucleic acid molecule is adapted to treat configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for creating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or charapies such as monoclonal antibodies, REL-A specific inhibitors or therapies such as monoclonal antibodies, REL-A specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatersate, chemated arrhitis; restenosis, asthma, Crohn's disease such as cobesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft crediction, gene therapy applications, ischaemia/reperfusion injury ceptection, gene therapy applications, ischaemia/reperfusion injury ceptection, this sequence represents the substrate of a novel enzymatic infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule

our in March 100 controlls. (1) made anticabetts, neutroprotective, cardiant, hypotennive, antiarteriosclerotic, antibacterial, virucide, fungicide, protozoacide, anticonvulsant, antiparkinsonian, nottropic, osteopathic, antiarthritic, antiinflammatory, dermatological, antiasthmatic, antilipaemic, vulnerary, antinflammatory, dermatological, antiasthmatic, antilipaemic, vulnerary, antinflammatory, dermatological, activities, and can be used in gene therapy. (I), nucleic acid encoding (I) and antibodies against (I) are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or disposing diseases such metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hyperension, atherosclerosis), neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders, asthma, and various dyslipidaemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate
                                                                                                                                                                                                                                                                                                                                                                                                                  ACC49051 to ACC49063 encode the human proteins designated NOVX (I), where X is la, lb, lc, 2a, 2b, 2c, 2d, 2e, 2f, 2g, 3a, 3b and 3c respectively, given in ABP97007 to ABP97019. (I) have antidiabetic, neuroprotective,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis and in gene therapy. The present sequence represents a PCR primer for a NOV2 sequence, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           c-jun; c-fos; jun-B; neuronal injury; cell death; neoplasm; antisense;

                                                                                                                                                                                          Use of antisense c-jun, c-fos or jun-B nucleic acids - for preventing and treating neuronal injury, degeneration, cell death and/or neoplasms.
                                                                                                                                                                                                                                                                             comprising the genes c-jun, jun-B or c-fos, expression of which plays a causal role in neuronal injury, degeneration, cell death and/ or neuronal injury, degeneration, cell death and/ or antisense sequences are described in AAQ83327-321 and AAQ83440-43; jun-B antisense sequences are described in AAQ83322-63 and AAQ83444-45; and c-fos antisense sequences are described in AAQ83364-439 and AAQ8346-51. Preferably the antisense sequences are phosphorothioate oligonucleotides since these are not destroyed as fast by endogenous factors as naturally occuring molecules. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                  Antisense nucleic acid hybridising with an area of the mRNA and/or DNA

```
The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising; (i) at least 5 ribose residues; (ii) a 2-C-allyl modification at position 4 of the ENA; (iii) at least ten 2'-c0—altyl modification at position 4 of the ENA; (iii) at least ten 2'-c0—acthyl modifications; and (iv) a 3'-end modification. The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for charance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of stromelysin without introducing the non-specific effects upon gene cypression which accompany treatment with retinoids and dexamethasone. The concentration of ribozyme required to affect a therapeutic treatment is lover than that required of antisense molecules, and is highly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, RhoB protein, antisense oligonucleotide, disease, RhoB expression, breast cancer, primer; phosphorothioate, ss.

This invention relates to an antisense compound targeted to a nucleic acid molecule encoding a member of the human Rho family of small GTP binding proteins, where the antisense compound inhibits the expression of the member of the human Rho family. The invention includes antisense oligonucleotides AAF94580 - AAF94637 which target a RhoA nucleotide sequence, AAF9465 - AAF94654 which target a RhoB nucleotide sequence, AAF94725 which target a Rho nucleotide sequence, AAF9475 which target a Rho nucleotide sequence, AAF94770 - AAF94765 which target a Rac I nucleotide sequence and AAF94765 - AAF94809 which target cafe a Rac I nucleotide sequence and AAF94765 - AAF94809 which target cafe 2 nucleotide sequence and AAF94765 - AAF94809 which target cafe 2 nucleotide sequence and AAF94765 - AAF94809 which target cafe 2 nucleotide sequence and AAF94765 - AAF94809 which target cafe 2 nucleotide sequence and AAF94765 - AAF94809 which target cafe 2 nucleotide sequence and AAF94765 - AAF94809 which target cafe 2 nucleotide sequence and AAF94767 - AAF94809 which target cafe 3 nucleotide sequence and AAF94767 - AAF94809 which target cafe 3 nucleotide sequence and AAF94767 - AAF94809 which target cafe 3 nucleotide sequence 3 nucleotide 3 nucleotide sequence 3 nucleotide 3 nuc
                                                                                                                                                                                                                                                                                              nucleotides in length, and are targeted to the gene encoding human RhoB. The antisense oligonucleotides may be useful for treating diseases associated with the expression of RhoB, such as breast cancer. They may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       An antisense compound targeted to a nucleic acid molecule encoding a member of the human Rho family of small GTP binding proteins useful for treating e.g. cancer and ischemia.

enables the construction of a scent representation (also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactory faculties of different individuals. The present sequence is homologous to a conserved region in transmembrane segment 2 (TM2) of G-protein coupled receptors. It was used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is provided in a specification relating to isolated polymucleotides which encode polypeptides involved in olfactory sensation. The polymucleotides can be used in screening for olfactory agonists and antagonists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are involved in detecting such secondary scents. This
hyperproliferative conditions, especially cancer, abnormal wound healing or clotting conditions and ischaemia/reperfusion or reoxygenation injury. The compound may also be used to diagnose the above conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   scent profile; scent fingerprint; scent representation; PCR primer; ss.

This invention describes a novel oligonucleotide which hybridises with and detects a nucleic acid from a filamentous bacteria cell. The filamentous bacteria cell. The filamentous bacteria call. The filamentous bacteria can include members of the 021N Kanagawa group I. II ozili, 021N-like from BIO33 BUZI, Alisphaera europaea EU24 Nostocoida limicola-like, Alisphaera (europaea, PPx3, MC2), Alisphaera MC2 MACOBS-Clone 2 (BIO 36), Bactothrix amylovca (EU3, EU9, EU9, EU1), Chloroflexus aurantiacus, Curtrema variabilis (type 0041), Cytophaga, EPTS Australian 021N isolate (EU21), EPTS Australian isolate EU33 from Megathrix sidereus EU26 Nostocoida/O21N-like, M. tenacis (WU12, EU5, EU6, EU15, EU15, EU13, EU14 EU1, EU1, EU12), Nostocoida limicolasne (EU24), Nostocoida limicolasne (EU24), Nostocoida limicolasne (EU24), EU15, EU13 EU14 EU1, EU10, EU2), Nostocoida limicolasne (EU24), Chiothrix ramose, Type O411 (CF) and Type 0403. When detecting filamenteus bacteria the oligonucleotide is preferably coupled with a filorancear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     fluorescent, chemiluminescent, radioactive, enzymatic or hapten marker. Detection is by epiflourescence microscopy or flow cytometry. The invention is used to detect filamentous bacteria in a sample, particularly in activated sludge. ADA83682-ADA83723 represent oligonucleotide probes used in the detection method of the invention.

The yeast of the invention may be used for producing food and drink with enriched gamma-glutamyl cysteine or cysteine which is can be cheaply produced with improved flavour. The current sequence is that of the food enrichment-related PCR primer of the invention.

The oligomer is used as a control oligonucleotide for studying inhibition of transcription of duplex DNA. Similar oligomers are capable of binding to the transcribed region of the DNA so as to form a triple helix. This interaction is compared to the binding of the control oligonucleotide to give accurate results. The target region may lie within an exon or an intron and the oligomer forms a triple helix by expliciting the GT motif (i.e. the oligomer is purine rich). The oligomer is useful in antisense therapy. It can also be used (opt. in labelled form) diagnostically to detect target DNA or RNA by hybridisation. See also AAQ25290-300. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                       Inhibiting transcription of duplex DNA in anti-sense therapy and diagnosis - by contacting the transcribed region of DNA with an oligomer to form triple helix.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New DNA sequences as DNA probes - for use in paternity and maternity

                                                                  The DNA probes represented in AAQ22441-76 are 15 nucleotide sequences wherein 8 nucleotides of each sequence are G, 3 are T, 1 is C, 1 is A and 2 are N, except that the nucleotide sequence is not the M13 consensus sequence GAGGGTGGNGGANTC. The probes can detect hyper-variable regions (HVRs) in genomic DNA with such precision as to enable individuals to be identified or fingerprinted by reference to variations in their DNA in these regions. The DNA probes can be used in paternity and maternity testing, zygosity testing in twins, cell chimerism studies, e.g. detection of donor versus recipient cells after bone marrow transplantation, forensic medicine, family gp. verification, tests for inbreeding, pedigree analysis, identification of loci or genetic diseases, animal or plant breeding and pedigree analysis authentication, duality control of cell lines and analysis. Preparation: The M13 sequence was initially randomised manually by the method of random sampling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TNF-alpha; respiratory syncytial virus; RSV; bcr-abl; oncogene; translocation; chronic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atheroselerosis; myocardial infarction; stroke; restenosis; transplant rejection; rheumatoid arthritis; psoriasis; myocardial; Kawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome; AIDS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                  without replacement to produce random sequences. Later a computer programme was written that implemented an algorithm that produced a random sequence by sampling thout replacement. Several of the rand sequences that were obtd. were synthesised, labelled and used as DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mouse relA hammerhead ribozyme target sequence (nt. position 1681).

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo
                                                                                                                                                                                                                                                                                                                                                         o DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW;

Ribozymes having modified bases and methods for producing them - for use inhibiting disease related genes. 므

## Claim 2; Page 173; 407pp; English

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to correct PI field.)

Regions of the mENA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with on 25-MAR-2003 to correct PI field.)

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The relA gene product is a subunit of the transcriptionallator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain
                                                                                                                                                                                                                                                                                                                                    b DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo treatment. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ribozymes having modified bases and methods for producing them - for use

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising; (i) at least 5 ribose residues (ii) a 2-C-allyl modification at position 4 of the ENA; (iii) at least ten 2'-O-methyl modification, and (iv) a 3'-end modification. The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for enhancing graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  stronglysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasone. The concentration of ribozyme required to affect a therapeutic treatment is lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enzymatic nucleic acid molecules having a hammer-head motif - used for
the treatment of arthritis, induction of graft tolerance or treatment of
auto-immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis. The ENA's can be used to treat antigen presenting cells of a donor to induce tolerance be used to treat antigen presenting cells of a donor to induce tolerance enhancing graft tolerance or for treating autoimmune disease, and for treating allergies and other inflammatory conditions. The ENA's can also allergies and other inflammatory conditions.

New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial hypercholesterolaemia.

Claim 4; Page 42; 72pp; English.

Table transfer protein (CETP) harmerhead (HH) ribozymes (see AAT50360-150546). CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme then binds to 5 nucleotides either side of this site. The ribozyme able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or eliminated) thereby preventing the reduction in size density of the high density lipoproteins (HDL), prolonging HDL half life, and therefore increasing HDL levels. The ribozymes can be used to treat conditions associated with hypercholesteroleamia, peripheral vascular disease, dyslipidaemia, decrease in LDL levels, and a corresponding increase in HDL levels). The HH ribozymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes AAT50138-T50359 represent target sequences for the rabbit cholesterol target specific regions of the CETP gene, they have low non-specific hyperbetalipoproteinaemia, hypoalphalipoproteinaemia, vascular complications of diabetes, transplant, atherectomy and angioplastic restenosis. By inhibiting CETP, the levels of HDL and low density lipoproteins (LDL), and the HDL:LDL ratio are favourably altered (a

useful for preventing or treating initial development, progression or regression of vascular diseases, esp. familial hypercholesterolaemia. New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA

Claim 4; Page 43; 72pp; English.

AAT50138-T50359 represent target sequences for the rabbit cholesterol ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAT50360-750564). CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme are concluded to a nucleotides either side of this site. The ribozymes are able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse collesterol transport (RCT) pathway can be inhibited (or eliminated) thereby preventing the reduction in size density of the high density conclusions (HDL), prolonging HDL half life, and therefore increasing the libororeins (HDL), prolonging HDL half life, and therefore increasing abnormal levels of CETP, specifically atherosclerosis, familial chypercholesterolaemia, peripheral vascular disease, dyslipidaemia, hypoalphalipoproteinaemia, vascular complications of diabetes, transplant, atherectory and angioplastic restenosis. By inhibiting CETP, the levels of HDL and low density createnosis. By inhibiting CETP, the levels of HDL and low density createnosis. By inhibiting CETP, the levels of HDL and low density createnosis. By inhibiting CETP, the levels of HDL and levels). The CHT reloxymes can also be used diagnostically to study genetic drift and mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes continic arribes in the CETP gene, they have low non-specific

The present invention describes a branched composition (I) which is useful for improving the solubility of synthetic polymers (II) or aids in minimizing or eliminating self-aggregation of (II), where (II) is a nucleic acid (or analogue), peptide, peptide nucleic acid (PNA), polyamide, chimera or a linked polymer. Modification of (II) by (I) can facilitate synthesis, purification and analysis of many insoluble polymers, and particularly purine-rich PNA polymers labeled with hydrophobic labels. The products can be used in research, diagnostic and therapeutic applications. The present sequence represents a PNA used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Branched compositions for improving the solubility of synthetic polymers or minimizing or eliminating polymer self-aggregation, particularly in peptide nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /*tag= a /*tag= a //note= "g is modified to Flu-OE-g where Flu is 5-(6)-carboxyfluorescein, O is 8-amino-3,6-dioxaoctanoic acid and E is an uncharged ether modifying moiety"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAV48709-886 represent antisense oligomucleotides directed against the ErbB-2 gene. Of these, only oligomucleotides AAV48709-91 resulted in significant redcution in ErbB-2 protein expression, while significant redcution in ErbB-2 protein expression, while oligomucleotides AAV48792-886 had little effect. The oligomucleotides aAV48792-886 had little effect. The oligomucleotides can each form three hydrogen bonds to cytosine; do not contain four consecutive nucleotides able to form three H-bonds each to four consecutive cytosines; do not contain two sequences of three consecutive nucleotides each able to form three H-bonds to three consecutive nucleotides each able to form three H-bonds to three consecutive cytosines, and the ratio between residues able to form two H-bonds each configuration of genes for Erb 2013 given by 2R/3R = 0.33-0.72. The coligomucleotides are used to modulate expression of genes, particularly proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The coligomucleotides can also be used to analyse function of proteins (by coligomucleotides can also be used to analyse function of proteins (by coligomucleotides can also be used to analyse function of proteins (by coligomucleotides can also be used to analyse function of proteins (coligomucleotides can also be used to analyse function of proteins (coligomucleotides can also be used to analyse function of proteins (coligomucleotides can also be used to analyse function of proteins (coligomucleotides can also be used to analyse function of proteins (coligomucleotides can also be used to analyse function of proteins (coligomucleotides can also be used to analyse demonstration of proteins (coligomucleotides can also be used to analyse demonstration of proteins (coligomucleotides can also be used to analyse of also coligomucleotides can also be used to analyse of coligomucleotides can also be coligomucleotides can also be coligomucleotides can also coligomucleotides can al

Macejak

Pavco PA,

The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis of virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatitis c virus (HCV) infection, other infectious diseases, autoimmune clancer. Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

Example 8; Page 85; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGB]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, clipammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-1900nucleotides of the present invention (see AAF45151 and AAF45153-19140). The method is useful for ameliorating the effects of psoriasis, nephasias, scleroderma, warts, bening growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia

```

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGR]-1 creceptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, coligonucleotide which can be used to design the antisense oligonucleotides of the present isquence is an oligonucleotides of the present invention (see AAF45151 and AAF45153-100) and operations is useful for ameliorating the effects of psoriasis, colichtyosis, pilorisis, unseful for ameliorating the effects of psoriasis, colophasias, scleroderma, warts, benign growths, cancers of the skin, and hyperneovascular condition such as a neovascular condition of the retina, byperneovascular conditions are neovascular condition of the retina, collesse, kidney disease, hyperproliferation of the inside of blood cuessels or any other hyperplasia

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

```

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 oligonucleotides of the present invention (see AAF45151 and AAF45153-
F45161). The method is useful for ameliotrating the effects of psoriasis,
ichthyosis, pityriasis, ruba, plaris, serborrhoea, keloids, keratosis,
neoplasias, scleroderma, warts, benign growths, cancers of the skin, a
hyperneovascular condition such as a neovascular condition of the retina,
brain or skin, growth factor-mediated malignancies, other sclerotic
disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 15 BP; 4 A; 4 C; 3 G; 4 T; 0 U; 0 Other;

Human Osteoclastogenesis Inhibitory Factor nucleotides, comprising single nucleotide polymorphisms, useful for studying e.g. osteoporosis, Paget's disease and rheumatoid arthritis.

Claim 15; Page 23; 114pp; English

```
The present invention relates to novel human nucleic acid sequences (I).

The present sequence is one such nucleic acid sequence. Expression of (I) are implicated in tumour suppression or reversion and apoptoesis and viral resistance. (I) are useful as probes or primers for detecting, identifying, measuring and/or amplifying nucleic acid sequences, as nucleis and for recombinant production of polypeptides. (II), polypeptides (II) encoded by (I), vector containing (I), cells containing these vectors and antibodies (Ab) against (II) are all useful for treatment/prevention of viral, tumour and cell degeneration diseases containing these vectors and antibodies (Ab) against (II) are all useful for treatment/prevention of viral, tumour and cell degeneration diseases containing the vectors and containing the expression of (I) is also useful for diagnosis and/or prognosis of such diseases. Transgenic animals carrying (I) are used for studying the aetiology of these diseases (also immune and inflammatory diseases). Note: In the present specification, SEQ ID 1 to 2270 are shown
                                                                                                                                                                                                                                                                                                   0
  probe used to detect polymorphisms in the human

                 osteoclastogenesis inhibitory factor (TNFRSFIIB). Polynucleotides comprising one or more of twenty four novel single nucleotides polymorphisms in the TNFRSFIIB gene have been identified. TNFRSFIIB regulate osteoclast recruitment and function. An understanding of variations in the gene should thus be useful in developing new therapies for metabolic disorders caused by abnormal osteoclast recruitment and function such as osteoporosis, metastatic bone disease, Paget's disease, rheumatoid arthritis and periodontal bone disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid implicated e.g. in tumor suppression, useful for diagnosis of tumors, viral infection and cellular degeneration and for

The method of the invention is useful for haplotyping the HMGCL gene in an individual and in design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with HMGCL activity and is useful for genotyping HMGCL gene of an individual. The method of the invention is also useful for identifying an association between a trait and at least one haplotype or haplotype pair of HMGCL gene. AsO is useful as probes and primers and for assaying a polymorphism in the target region. The invention is useful for genotyping and/or haplotyping the HMGCL gene in an individual. Without
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           requiring any a prior knowledge of the phenotypic effect of any particular HMGCL haplotype or haplotype pair, the method of the invention provides the scientist with a tool to identify lead compounds that are more likely to show efficacy in clinical trials. The present nucleic acid sequence represents one of a collection of ASO probes (ABK14040-ABK14045)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel genetic variants of 3-hydroxy-3-methylglutaryl coenzyme A lyase useful in screening drugs to treat disease associated with the protein e.g. 3-hydroxy-3-methylglutaryl coenzyme A deficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, 3-hydroxy-3-methylglutaryl coenzyme A lyase; HMGCL; probe; ss;

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV control of the substrate sequences defined in the specification. The HCV control of HCV They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was contained in electronic format directly from the USPTO web site at

The present invention provides the human neuropeptide Y (NPY) gene and single nucleotide polymorphisms (SNPs) identified therein. The sequence can be used in the treatment of disorders associated with NPY, including atherosclerosis, obesity, psychological disorders and alcoholism. The present sequence is an allele specific probe used to isolate the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New genetic variants of the human Neuropeptide Y (NPY) gene useful for treating disorders affected by abnormal expression or function of NPY isogene e.g., atherosclerosis or obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a peptide nucleic acid capable of hybridising to a target sequence of Mycobacterial rDNA, precursor rRNA or rRNA (5S, 16S or 238) forming detectable hybrids. Also included are detecting a target sequence of mycobacteria in a sample comprising contacting rRNA or rDNA in the sample with peptide nucleic acid probes (hybridisation takes place between the probe and the rRNA or rDNA), observing or measuring any formed detectable hybrids and relating the observation or measurement to the presence of a target sequence of mycobacteria in the sample, and a kit for detecting a target sequence of mycobacteria in particular a target sequence of mycobacteria in particular a probes are used for detecting a target sequence of Mycobacteria of Mycobacteria conflux (MTC). The probes are used for detecting a target sequence of MYCOBacteria mycobacterium other than tuberculosis, MOTT)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present in a sample, e.g. sputum, laryngeal swabs, gastric lavage, bronchial washings, biopsies, aspirates, expectorates, body fluids, urine, tissue sections as well as food samples, soil, air and water samples and their cultures. The probe is able to penetrate the cell wall of the mycobacteria. It is able to hybridise to Mycobacterial precursor trNRA and trhout harsh treatment of the mycobacterial cells, therefore avoiding a risk of interfering with the morphology of the cells. The present sequence is an M. tuberculosis probe for 165 or 235
                                                                                                                                                                                       Peptide nucleic acid probes for detecting target sequences of Mycobacteria in samples, e.g., sputum, which are capable of hybridizing to a target sequence of mycobacterial rDNA, precursor rRNA or rRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polyworphism (SNP) in the optineurin promoter operably linked to a heterologous sequence, diagnosing of promoter operably linked to a heterologous sequence, diagnosing or prognosing glaucoma in a sample obtained from a cell or bodily fluid (comprising detecting a polymorphism of a phenotype), detecting a SNP sequence variation in a sample containing on a sample containing DNA, determining the presence or increased susceptibility to glaucoma or to a progressive ocular hypertensive disorder resulting in loss of visual field in a patient (or the severity any perfession of glaucoma in a patient, comprising providing camplification reaction primers that direct amplification of a selected nucleic acid region containing the variation within the optineurin containing a mample of detecting a polymorphism (comprising cobtaining a sample containing human genomic DNA, providing a nucleic acid detecting a SNP located within an optineurin promoter, and diagnose and correcting the polymorphism). The invention is used to diagnose and present sequence is an optineurin promoter motif, repeat element or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to novel proteins (ADE52648-ADE52660, ADE52670 and ADE52672) and their coding sequences (ADE52635-ADE52647,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Proteins with DNA binding activity and substances that affect their activity or expression, useful for treating associated disorders.

                                                                                                                                                                                                                                                              undergoing formation/dissociation of a supercoil or rotation in response to an external stimulus and comprises a number of plasmid DNAs ligated in it. The DNA organization is applicable in various materials and body parts or medical micromachines e.g. artificial muscles. This sequence represents an oligonucleotide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid (NI) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADE13890. Also included are the optineurin promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid sequences of the optineurin gene are useful to detect polymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, optineurin, ds, ophthalmological; single nucleotide polymorphism, SNP; glaucoma; progressive ocular hypertensive disorder; glaucoma related disorder; motif; repeat element; regulatory region.
                                                                                                                   Stimulus-responsive DNA organization of highly compatible functional material undergoing reversible formation/dissociation of supercoil or rotation in response to external stimulus, useful as e.g. artificial
                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Optineurin promoter motif, repeat element or regulatory region #111.
                                                                                                                                                                                                                                               The invention relates to a stimulus-responsive DNA organization
                                                                                                                                                                                                                                                                                                                                                                                                                                                .,

                                                                                                                                                                                                                                                                                                                                                                                                                            Oligo:nucleotide primer comprising amplification and sequencing portions - useful for determination of fungal DNA sequences by PCR amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAT02855-T02860 are amplification primers for DNA coding for fungusderived 18S rRNA. These primers may be bound at the 5' end to the 3' end of a sequencing primer (AAT02861-T02863). The resulting oligonucleotide primers comprising amplification and sequencing portions (AAT02864-T02869). These primers are useful for the determination of the base sequences of fungi
ADE52669 and ADE52671). The proteins have a DNA-binding activity or an interferon-activatable protein (IAP)-like activity. The present oligonucleotide is related to HSFI (short), HSF2, dHSF and fungalHSF.

Sequences AAV45755-V45770 are capture probes which are surface bound and arranged in an array of biosites attached to a solid support. These are designed to bind rapidly and efficiently to the target probes (AAV4571-V45786) capture domain. They can be used in the method of the invention in the following areas: diagnosis, drug screening, analysis of gene expression, cell sorting and microorganic monitoring, analysis of multiple point mutations and genotyping

```
This invention describes the isolation of a novel numen muscathinic cactylcholine receptor 6 (mACHR-6), capable of modulating the effects of acetylcholine receptors 6 (mACHR-6), capable of modulating the effects of acetylcholine na acetylcholine responsive cells. mACHR-6 cDNAs and polypeptides may be used to detect naturally occurring mutations of the macHR-6 gene and determine if a subject with the mutated gene is at risk of (or is predisposed to have) a macHR-6 related disorder, modulate cell corresponding the macHR-6 (e.g. biological processes mediated by a certivity mediated by mACHR-6 (e.g. biological processes mediated by a certival partial disorders and signaling), secretion of a molecule gmooth muscle cell, treat disorders mediated by abnormal mACHR-6 activity smooth muscle cell, treat disorders mediated by abnormal mACHR-6 activity smooth muscle cell, treat disorders mediated by abnormal mestic dysnomia, amnestic spatial disorientation, Kluver-Bucy syndrome, alzheimer's related memory loss and learning disability, visual.

Alzheimer's related memory loss and learning disability, visual.

Alzheimer's related memory loss and learning disability, visual.

Alzheimer's related memory loss and learning disorders; sleep anormalities, and depressive illness, affective disorders; e.g. claep watefulness, and body temperature or respiratory depression of abnormalities during sleep), pain generating mechanism disorders (e.g. related to Parkinson's disease), cathor disorders (e.g. related to Parkinson's disease), cathor disorders (e.g. related disease), cathor disorders (e.g. pathologic chronic obstructive airways disease), cardiac disorders (e.g. pathologic chronic obstructive airways disease), cardiac disorders (e.g. pathologic bradycardia or tachycardia, arrhythmia, flutter and fibrillation), and corrected or electronic and dispetes mellitus and disorders (e.g. pathologic bradycardia or tachycardia, arrhythmia, flutter and fibrillation), and corrected or electronic obstructive airways disease), cardiac disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                This invention describes the isolation of a novel human muscarinic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      4.1%; Score 11.8; DB 1; Length 16; 86.7%; Pred. G protein coupled receptor; flh84g5; human; diagnosis; screening; therapy; antiparkinsonian; nootropic; neuroprotective; neuroleptic; antidepressant; antiarrythmic; antidiabetic; antiinflammatory; phosphatidylinositol; antisense; ss.

Homo sapiens WO9928470-A1 10-JUN-1999 Synthetic

98WO-US025832. 04-DEC-1998;

This oligonucleotide is complementary to a portion of the 3' untranslated region of the human G protein coupled receptor fin8455 gene corresponding to nucleotides 2133-2148 of the sequence given in AAX53167. It can be concluded to modulate fin8465 activity, and hence to treat a disease or disorder characterized by, or associated with, aberrant or abnormal fin8455 nucleic acid expression and/or fin8455 polypeptide activity by inhibiting fin8466 nucleic acid expression. Biseases and disorders system related disorders, e.g. ammesia, apraxia, agnosia, ammestic system related memory loss and learning disability; disorders affecting consciousness such as viewal hallucinations, perceptual disturbances or delerium associated with Lewy body dementia, schizzo-cffective disorders, schizophrenia with mood swings, depressive illness of frimary and secondary); affectived disorders such as viewal promession, paradoxical abnormalities in patients suffecting from e.g. depression, paradoxical costing pain generation mechanisms e.g. pain related to irritable bowel syndrome pain generation mechanisms e.g. pain related to irritable bowel syndrome convenent disorders; eating disorders e.g. insulin hypersecretion related obesity or drinking disorders e.g. insulin hypersecretion related coesity or drinking disorders e.g. insulin hypersecretion always disease; cardiac muscle disorders, e.g. pain characterion and disorders, e.g. intribale bowel syndrome, diverticular disease, criardaceders, e.g. intribale bowel syndrome, diverticular disease, cardiac muscle disorders, e.g. pathologic bradycardia, always disease, cardiac muscle disorders, e.g. pathologic bradycardia, arrhythmia, flutter or fibrillation; and gland related New nucleic acid encoding an isolated G-protein coupled receptor useful for treating nervous system related disorders. ```
The present invention describes muscarinic acetylcholine receptor 6
(mACHR-6), which is a member of the G family of proteins. mACHR-6 has
antiparkinsonian, nootropic, neuropratective. neuroleptic, antidiabetic
antidepressant, antiarrhythmic and antidiflammatory activities. The mACHR-6 protein, is capable of modulating the effects of a G-protein coupled
receptor (GPTR) ligand such as acetylcholine or an acetylcholine like
ceceptor (GPTR) ligand such as acetylcholine or an acetylcholine like
molecule such as carnitine, e.g. by modulating phospholipase C
signalling/activity. Products from the present invention can be used for
treating disorders mediated by abnormal mACHR-6 protein activity such as
nervous system related disorders, disorders affecting
factive disorders such as RBM sleep abnormalities, disorders affecting
pain generation mechanisms such as pain related to irritable bowel
syndrome or chest pain, movement disorders, cardiac muscle disorders, and
disorders, smooth muscle related disorders, arting disorders, and
cland related disorders such as xerostomia or diabetes mellitus. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           products can also be used for detection, diagnosis and drug screening. The present sequence represents a rat mACHR-6 antisense oligonucleotide which is given in the exemplification of the present invention. (Updated on 20-MAR-2003 to correct DR field.)
                                                                                                                                                                                                                                                                                                                                         nucleic acid encoding an isolated G-protein coupled receptor useful treating nervous system related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human leukocyte antigen, HLA, class I allele type; probe; PCR primer; amplification, hybridisation; organ transplant; gene typing; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human leukocyte antigen PCR primer BASF-1 SEQ ID NO:88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 16 BP; 2 A; 6 C; 5 G; 3 T; 0 U; 0 Other;

The present invention describes a method for distinguishing a human pleukocyte antigen (HLA) class I antigen or allele by a combination of polymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B or -C alleles can be amplified or using reverse hybridisation analysis comprising a DNA probe covalently bonded to microtitre plate wells which are hybridisable specifically with the base sequence of at least one specific HLA-A, -B or -C allele. The method is applicable in gene typing, judging donor-recipient compatibility during organ transplant and correlation analysis for diagnosis of various diseases. The method is simple, rapid and accurate, with possibility of mechanisation and automation, without the problems encountered by using the prior-art techniques. AAA66943 to AAA66772 represent oligonucleotide probes and PCR primers for use in the method of the present invention
                                                                                                                                                                                      Simple, rapid and accurate method for distinguishing HLA class I allele type with possibility of mechanization and automation, applicable in judging donor-recipient compatibility during organ transplant and disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sodium channel; modulator; sodium channel beta-1A subunit; pain; rat; analgesic; neuroprotective; RT-PCR; primer; ss.

The invention relates to a method of screening for a modulator of sodium channel activity that comprises contacting a candidate modulator with a cell co-expressing a sodium channel beta-ih submint with a sodium channel alpha submint, and determining the effect of the candidate modulator on the sodium channel function in the cell. The method is useful for identifying sodium channel activity modulators, preferably causing decreased beta ih submint expression. The modulators can be used to decrease neuropathic pain, and to decrease the number of febrile seizures comprises contacting a candidate compound with a cell in an individual. The present sequence represents a reverse primer beta1A5 used in RT-PCR amplification of the DNA encoding a rat sodium channel beta-1A subunit Example 1; Page 78; 124pp; English. expressing the channel pain, neuropathic

WPI; 2001-258136/26.

An isolated nucleic acid encoding a sodium channel betalA subunit polypeptide, useful for identifying modulators of sodium channel betalA subunits and treating neuropathic pain. Example 1; Page 79; 121pp; English. The present sequence is that of PCR primer betalA5. The primer is based on a sequence unique to rat sodium channel betalA subunit. It was used with primer betalA3 (see AAF30670) to confirm that a betalA transcript identified by library screening was expressed by rat adrenal gland. The primers amplify a region of betalA from the N-terminus past the region in which the amino acid sequence changed from identity to non-identity to betal, or the putative splice site, by RT-PCR using rat adrenal gland total RNA as template. Novel rat sodium channel betalA subunit (see AAB20371) is a splice variant of sodium channel betal, resulting from

retention of intron 3 containing an in-frame stop codon. This alternative splicing event produces a novel C-terminus. Methods and compositions for using betalA nucleic acids and proteins are described. A claimed method of screening for a modulator of sodium channel activity utilises a cell co-expressing a sodium channel betalA subunit and a sodium channel alpha subunit. A claimed method for decreasing neuropathic pain, and a claimed method for decreasing the number of fibrillar seizures in an individual, both involve administering a modulator of the sodium channel betalA 4.1%; Score 11.8; DB 1; Length 16; 86.7%; Pred. Inducing apoptosis in a tumor cell for treating cancer, e.g. prostate cancer, by introducing a DNA construct comprising coding region of DNA repair inhibitory agent linked to tissue-specific regulatory sequences. Ä Smulson M, Soldatenkov VA, Jung M, WPI; 2002-583512/62.

Dritschilo

Example; Page 19; 41pp; English.

The invention relates to inducing (M) apoptosis in a cell for treating cancer, comprising introducing into the cell a recombinant DNA construct having the coding region of a DNA repair inhibitory agent linked to tissue-specific transcriptional regulatory sequences. (M) is useful for tissue-specific transcriptional regulatory sequences. (M) is useful for inducing apoptosis in a tumor cell, including lung, breast, colon, liver, color kidney, kin, or ovarian tumour cell, aquamous cell carcinoma, non-squamous cell carcinoma, glioblastoma, ascoma, melanoma, papilloma, neuroblastoma and leukaemia cell. (M) is useful for treating cancer, such cas brain, stomach, breast, ovarian, cervical, prostate, skin, lung, pancreatic, liver, colon cancer and leukaemia. The method involves administering the host by genotoxic treatments. The host is a human diagnosed with cancer. The genotoxic treatments comprises chemotherapeutic drugs or radiation such as gamma-irradiation, X-rays, microwaves, electronic companions and the like. The chemotherapeutic drugs are alkylating agents (e.g. cis-diamine dichloroplatinum or melphalan), inhibitors of DNA replication, mitosis or chromosomal segregation, (e.g. etcoposide (VP-16),

.. 0 camptothecin and adriamycin also known as doxorubicin) and radiomimetic agents (e.g. bleomycin). The present sequence is that of a PCR primer for RT-PCR analysis of a human DBD-Flag fusion protein used in examples of Gaps . 0 Length 16; 2; Indels Sequence 16 BP; 6 A; 7 C; 0 G; 3 T; 0 U; 0 Other; Score 11.8; DB 1; Pred. New muscarinic acetylcholine receptor 6 (mACHR-6) nucleic acids and proteins, useful for modulating acetylcholine or phosphatidylinositol, particularly for treating e.g. schizophrenia, chest pain, tachycardia or

Disclosure; Page 26; 66pp; English.

The invention relates to an isolated human or rat muscarinic acetylcholine receptor 6 (mACHR-6) nucleic acid molecule and the encoded protein. Also included are (non-human) host cells comprising the mACHR-6 nucleic acid molecule, an antibody that selectively bind the polypeptide above, a method for producing the polypeptide by culturing the host cell such that the mACHR-6 nucleic acid is expressed, a method for detecting the presence of the mACHR-6 polypeptide and nucleic acid, a method for identifying a compound that binds to the mACHR-6 polypeptide and a method for modulating the activity of the mACHR-6 polypeptide. The mACHR-6 polypeptide, antibody or modulator are useful in drug screening assays, diagnostic assays for identifying diseases, allelic screening, pharmacogenetic testing, methods of treatment,

Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.

Claim 4; Page 81; 218pp; English.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient preferably human having a condition associated with the level of the fms-like tyrosine kinase 1 (fl.t-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (fll-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour analogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         gene expression or mRNA
                                                                                                                                                                                                           Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid molecule modulating VEGF receptor(s) gene expression or
stability - useful for treating e.g. tumour angiogenesis, psoriasis,
rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .,
                                                                                                                                                                                Human flt1 VEGF receptor hammerhead ribozyme substrate #934.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               4.1%; Score 11.8; DB 1; Length 17; 66.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (fl-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
                                                                                          Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      stability – useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecule modulating VEGF receptor(s) gene expression or stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

mRNA

```
The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fll-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rhoumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression of nucleic acid molecules from the present invention
                                                                                                          expression or mRNA
                                                                                                    Nucleic acid molecule modulating VEGF receptor(s) gene expression or stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.

(RIBO-) RIBOZYME PHARM INC. (UYAS-) UNIV ASTON.

Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for treating cancers.

Claim 5; Page 68; 109pp; English.

The present invention describes enzymatic nucleic acid molecules (NAMs) which specifically cleave RNA derived from an epidermal growth factor receptor (BCR-R) gene. AAV07221 to AAV08044 and AAV08049 to AAV09000 represent specifically claimed target sequence from human EGP-R. AAV090044 to AAV98066 and AAV98067 to V9078 represent hammerhead ribozymes and hairpin ribozymes respectively for human BGF-R. The NAMs are useful for cleaving BGP-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell

```
The present invention describes enzymatic nucleic acid molecules (NAMS) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV99090 represent specifically claimed target sequence from human EGF-R. AAV98044 to AAV98866 and AAV98867 to V9978 represent hammerhead ribozymes and hairpin ribozymes respectively for human EGF-R. The NAMS are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit call proliferation in the prevention or trreatment of cancers. The NAMS can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell

The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (IL)-2R gamma encoded RNA. AAV93889 to AAV94574 represent specifically claimed ribozymes, and AAV95250 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graft rejection, autoimmune disease, cancer, psoriasis, allergy and other inflammatory conditions. The ribozymes are also used to induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    inflammatory conditions. The ribozymes are also used to induce
                                                                                                                                                                                                                                                                                                                                                                                       Ribozymes targetted to interleukin 2 - useful for treating e.g. cancer, autoimmune disease and allergies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; IL-2 receptor g-chain; interleukin 2 receptor gamma chain; hammerhead ribozyme; hairpin ribozyme; substrate; expression; cancer; autoimmune disease; psoriasis; allergy; inflammatory disease;

```
the synthesis and/or expression of interleukin (IL)-2R gamma encoded RNA. ANY93889 to ANY94574 represent specifically claimed ribozymes, and AAV94675 to AAV95260 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graft rejection, autoimmune disease, cancer, psoriasis, allergy and other inflammatory conditions. The ribozymes are also used to induce tolerance in a recipient to alloantigen from a donor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (IL)-2R gamma encoded RNA. AAV93889 to AAV94574 represent specifically claimed ribozymes, and AAV94575 to AAV95260 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graff rejection, autoimmune disease, cancer, psoriasis, allergy and other inflammatory conditions. The ribozymes are also used to induce tolerance in a recipient to alloantigen from a donor
The present sequence invention describes ribozymes targeted to modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ribozymes targetted to interleukin 2 - useful for treating e.g. cancer, autoimmune disease and allergies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, IL-2 receptor g-chain; interleukin 2 receptor gamma chain; hammerhead ribozyme; hairpin ribozyme; substrate; expression; cancer; autoimmune disease; psoriasis; allergy; inflammatory disease;

                                                                                                                                                                                                                                                                                                                                                                    The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (IL)-2R gamma encoded RNA. AAA93889 to AAA94574 represent specifically claimed ribozymes, and AAA95875 to AAA95260 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graft rejection, autoimmum disease, canner, psoriasis, allergy and other inflammatory conditions. The ribozymes are also used to induce tolerance in a recipient to alloantigen from a donor
                                                                                                                                                                                                                                                           Ribozymes targetted to interleukin 2 - useful for treating e.g. cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ribozymes targetted to interleukin 2 - useful for treating e.g. cancer, autoimmune disease and allergies.

Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.

Claim 56; Page 132; 305pp; English.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17165 and AAA17165 to AAA17681 to AAA17684 represent their corresponding target sequences; AAA17685 to AAA18385 and AAA19086 and AAA19155 to AAA19152 represent their corresponding target sequences; CC AAA19152 to AAA1922 represent their corresponding target sequences; CC and AAA1922 represent their corresponding target sequences; AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme sequences; AAA1689 to AAA20361 and AAA21501 to AAA21362 to AAA23343 to AAA21689 to AAA21689 represent their corresponding target sequences; AAA21689 to AAA21689 represent their corresponding target sequences; AAA21689 to AAA21683 represent their corresponding target sequences; AAA21689 to AAA21683 represent their corresponding target sequences; AAA21689 to AAA21683 to AAA23262, AAA23343 to AAA2342 represent their corresponding target sequences; Cfor integrin subunit beta 3, and AAA23476 to AAA23362, AAA23343 to the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARWI, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related to macular degeneration (ARWI), inflammation, and arthritis, as well as engicibroma of tubercus sclerosis, pot-wine stains, Sturge Weber cyndromes and diseases related to the levels of ARNI, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3 integrin subun

Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an anglogenic factors.

Claim 55; Page 180; 305pp; English.

the present invention to tescribes enzymatic nucleic action molecules with KNA cleaving activity, which specifically cleave RNA encoded by an arryl hydrocarbon nuclear transporter (ARNT) gene, an integrin submit beta 3 cene, an integrin alpha 6 submit gene, or a Tie-2 gene AAA1761 to AAA1762 represent ribozyme sequences for ARNT, and AAA1766 to AAA17650 and AAA17684 represent their corresponding target sequences; AAA17685 to AAA19885 to AAA19885 to AAA19822 represent their corresponding target sequences; AAA19223 to AAA19222 represent their corresponding target sequences; AAA19223 to AAA21861 and AAA21801 to AAA21895 represent ribozyme sequences; AAA19223 to AAA21868 encorresponding target sequences; AAA19223 to AAA21868 encorresponding target sequences; AAA18923 to AAA21689 to AAA21689 represent their corresponding target sequences; AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequences; AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequences; Cor integrin submit beta 3, and AAA22476 to AAA23243 hat ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, cor filed to treat cancer, diabetic retinopathy, age related macular degeneration (ARND), inflammation, and arthritis, as well as corpusation and tuberous solerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, The present invention describes enzymatic nucleic acid molecules with RNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                               8888888888
                                                                                                                             0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA1575 to AAA17677 and AAA1761 to AAA1762 represent ribozyme sequences for ARNT, corresponding target sequences; AAA1683 to AAA1888 and AAA1908 and AAA19154 represent ribozyme sequences for Tie-2, and AAA1908 and AAA19155 to AAA1922 represent their corresponding target sequences; AAA18236 to AAA1908 and AAA1923 represent their corresponding target sequences; AAA18236 to AAA1928 and AAA1923 represent their corresponding target sequences;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and AAA21596 to AAA21688 represent their corresponding target sequences; AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel ribozymes for modulating the synthesis, expression and/or stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antidiflammatory; antiarthritic; antipsoriatic; ARWD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; poerviasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss.

AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes, and diseases related to the levels of ARNT, Tie-2,

Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (RNRT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17650 and AAA17623 to AAA17684 represent their corresponding target sequences; AAA17654 to AAA18986 to AAA19086 and AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to AAA19155 to AAA19222 represent their corresponding target sequences;

sequences for integrin alpha 6 subunit, and AAA20362 to AAA21600 and AAA21569 to AAA21688 represent their corresponding target sequences; AAA21689 to AAA22468 represent their corresponding target sequences; for integrin subunit beta 3, and AAA22476 to AAA23362, AAA2343 to AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as necovascular glaucoma, myopic degeneration, psoriasis, vertuca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2. AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme integrin subunit alpha-6, or integrin subunit beta-3  $\mathcal{G}_{\mathcal{G}}^{\mathcal{G}}(\mathcal{G}_{\mathcal{G}}) = \mathcal{G}_{\mathcal{G}}^{\mathcal{G}}(\mathcal{G}_{\mathcal{G}}) + \mathcal{G}$

preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs. Detection of single nucleotide polymorphisms in genomes by

Disclosure; Page 67; 111pp; English.

SNP A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a sallele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a

A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a Stallele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be use to perform linkage analysis. AAA35944 to AAA3547 represent sequences used in the exemplification of the present invention. AAA35948 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection of single nucleotide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs.
                                                                                                                                                                                                                                       Human, single nucleotide polymorphism; SNP; genotyping; DNA analysis; allele specific oligonucleotide; ASO; reduced complexity genome; RCG; genomic classification; identification; DNA fingerprinting; tumour characterisation; hybridisation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                        Human genomic SNP allele specific oligonucleotide SEQ ID NO:495.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate with a target sequence and contain at least one phosphoro(di)thioate clink, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor. Gene, are used to treat cancer (particularly of breast or endometrium), compared to transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restrictions in (A) improves used with DNA). The combination of modifications in (A) improves ceptatesiance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor haripin ribozyme sequences.

CC AAA24748 to AAA25992 represent their corresponding target sequences.

CC AAA24748 to AAA25992 represent their corresponding target sequences.

CC AAA25953 to AAA26105 represent their corresponding target sequences.

CC AAA256105 represent oestrogen receptor haripin ribozyme sequences and antisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleic acids that interact, and optionally cleave, target sequences,
Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1644.
                                     Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; hammerhead ribozyme; hairpin ribozyme; antisense oligonucleotide; gene expression modification; cancer; phosphorothioate; endonuclease; anticancer; breast cancer; endometrium cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 17 BP; 4 A; 3 C; 5 G; 5 T; 0 U; 0 Other;

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, ERA3/COUP-TF-1, the GATA transcription factor gene, IRR-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                              Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF1, the GATA transcription factor gene, IRF-2 and/or the CAATI Displacement Protein (CDF). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chk1) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chk1 levels,
                                                                                                                                                                          The present invention relates to an oligonucleotide array comprising array is useful for genotyping a nucleic acid sample at one or more loci array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide polymorphism (SNP). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers.
                                                                          Universal array of oligonucleotides tags attached to a solid substrate along with locus-specific tagged oligonucleotides useful in genotyping using single base extension reactions.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGOO). The nucleic acids may be enzymatic nucleic acids cleaving a an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NNN motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NNN motif) proposessing an NCH motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA cof CD20 in the presence of a divalent cation that is preferably MG^2^+.

CC CD20 in the presence of a divalent cation that is preferably MG^2^+.

CC CD20 in the presence of a divalent comprise the use of one or more cof cD20. The treatment may further comprise the use of one or more of cD20. The treatment may further comprise the use of one or more cof cD20. The treatment may further CD20 targetting nucleic acid may be used to creat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphoma, leukaemia, HTV (human immunodeficiency virus) associated NHL, lymphoma, lymphoma, (NCC), immunocytoma (NMC), small B-cell lymphocytic lymphoma, immunodeficiency virus) associated NHC, mantle-cell immune thrombocytopaenia, and inflammatory arthropathy. The NOGO crayetting nucleic acid may be contacted with a cell to reduce NOGO activity of the colling a patient having a condition associated with the level of colling a patient having a condition associated with the level of colling and treat a patient having a condition associated with the level of therapies. In particular, the NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO activity of the therapies. In particular, the NOGO-targetting nucleic acid may be need to cleave, dementia, multiple sclerosis (MS),

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 81; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a D20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids an NCH motif), a G-cleaver (cleaving RNA with a NNN motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NNN motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NNN motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NNN motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NGN motif) of CD20 in the presence of a divalent cation that is preferably MG^2+.

CC with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably MG^2+.

CC treat lymphoma (NED) bulky low-grade or follicular non-floadgrin's lymphoma (NED) bulky low-grade or follicular non-floadgrin's lymphoma (NED), immunocytoma (IMC), small B-cell lymphocytic lymphoma, cleave RNA, in a seciated with the level lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, cleave RNA, in a secondard or divalent cation that is preferably MG^2+. Furthermore, the creatment may further comprise the use of one or more cated and treat a patient having a condition associated with the level of the cargetting nucleic acid may be contacted with a cell to reduce NGO gene in the cated that nervous system (CNG) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), chemotherapy-induced neuropathy, and/or other neurodegenerative disease starka, Huntington's disease, ceruses which respond to the modulation of NOGO expression. The present contacted the invention of NOGO expression. The present sequence is an inozyme of the invention

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 30; Page 154; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a cD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGCO). The nucleic acids and the presence of a color acid cleaving a an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NGN triplet).

CC G-CD20 in the presence of a divalent cation that is preferably Mg⁻²+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more theory of the Data of the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, llw llw, bulky low-grade or follicular non-low may number thrombocytopaenia, and inflammatory arthropathy. The NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO sense in the presence of a divalent cation that is preferably Mg⁻²+. Purthermore, the coll and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more coll and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more coll and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more coll and treat a patient having a condition associated with the level of therapies. In particular disease, demential multiple sclerosis (ALS), chemotherapy-induced neuropathy, amd/or other neuropathy and/or other neuropathy and/or other neuropathy acid to the resur sequence is a zinzyme molecule of the invention
